REPORT & COURSE INFORMATION

Report Title: Visualization and Statistical Analysis on Used Car Market (Toyota Yaris)

Course Title: BBM100 (Descriptive Analytics)

Module Lead: Gary Simpson

Date of Submission: 14th August 2026

PREPARED BY

Candidate No : 886132

EXECUTIVE SUMMARY

This report evaluates the used Toyota Yaris market within a 50-mile radius of central Birmingham, drawing on live market listings across the West Midlands. The local Yaris market is sharply divided into two distinct segments: Budget Segment and Premium Segment

On the other hand, core drivers of resale values are fuel type, mileage, engine size and transmission type

Hybrid variants are premium over traditional petrol and diesel options. Also odometer reading is can vary price. As well as 5-door configurations hold a clear value advantage over 3-door models. In term engineering, While automatic vehicles list at substantially higher prices than manuals, statistical modeling reveals this is heavily tied to powertrain overlap—Toyota's hybrids inherently use automatic gearboxes. The primary price driver is the hybrid technology itself, rather than the gearbox alone.

APPENDIX 18

1. INTRODUCTION

UK's second-hand car market is fast-moving and unpredictable, with prices constantly shifting based on vehicle condition. For traders looking for profitable stock and buyers seeking a fair deal This report explores key factors determine price of a used Toyota Yaris.

Toyota Yaris is an ideal focus for this analysis. Recognized globally as one of the most reliable car, it holds a substantial market share across the UK and offers a rich mix of petrol models and fuel-efficient hybrids

By analyzing market data from Auto Trader UK, it provides a clear, data-driven look at how different factors impact vehicle valuation

1.1 Data Collection

All data was collected from **AutoTrader UK**, The primary query target was strictly filtered for the **Toyota Yaris** to capture localized pricing dynamics across different vehicle trims and production years. All the data was collected on 1st week of August2026

Car Model: Toyota Yaris

Location: Postcode B4 7DR in central Birmingham, applying a strict 50-mile search radius.

Population: The initial search criteria produced a total population size of 146 active vehicle

Sample size and Collection Method: To construct an unbiased subset for analysis, a sample size of **121 vehicles** was drawn from this baseline population. Sampling was conducted using Microsoft Excel's RANDBETWEEN () function

Variables: Price, mileage, gear, fuel type engine size and doors

1.2 Limitation

Geographic Scope: Data is limited to a 50-mile radius around central Birmingham (B4 7DR) and may not fully reflect broader UK market trends.

Unobserved Factors: Key qualitative details like service history, physical condition, tire wear, and past damage are unrecorded, despite influencing real-world value.

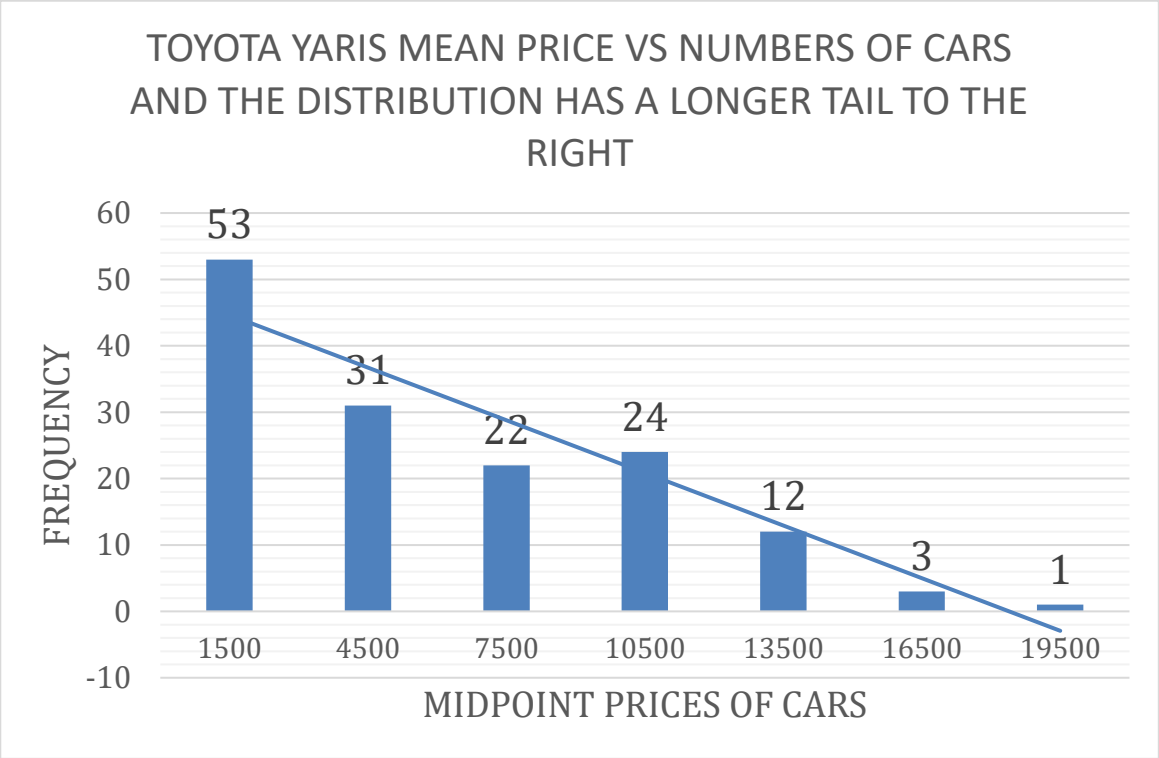

Asking vs. Sale Price: Figures reflect AutoTrader listing prices rather than final negotiated transaction amounts, which may be slightly lower.

Point-in-Time Snapshot: The data reflects a single market snapshot and does not account for ongoing fluctuations in stock availability or economic conditions.

2. POPULATION PARAMETER

Before diving into specific price factors, it helps to step back and examine how prices are distributed across the entire dataset of 146 Toyota Yaris listings. Establishing this broader market picture provides essential context for the sample analysis

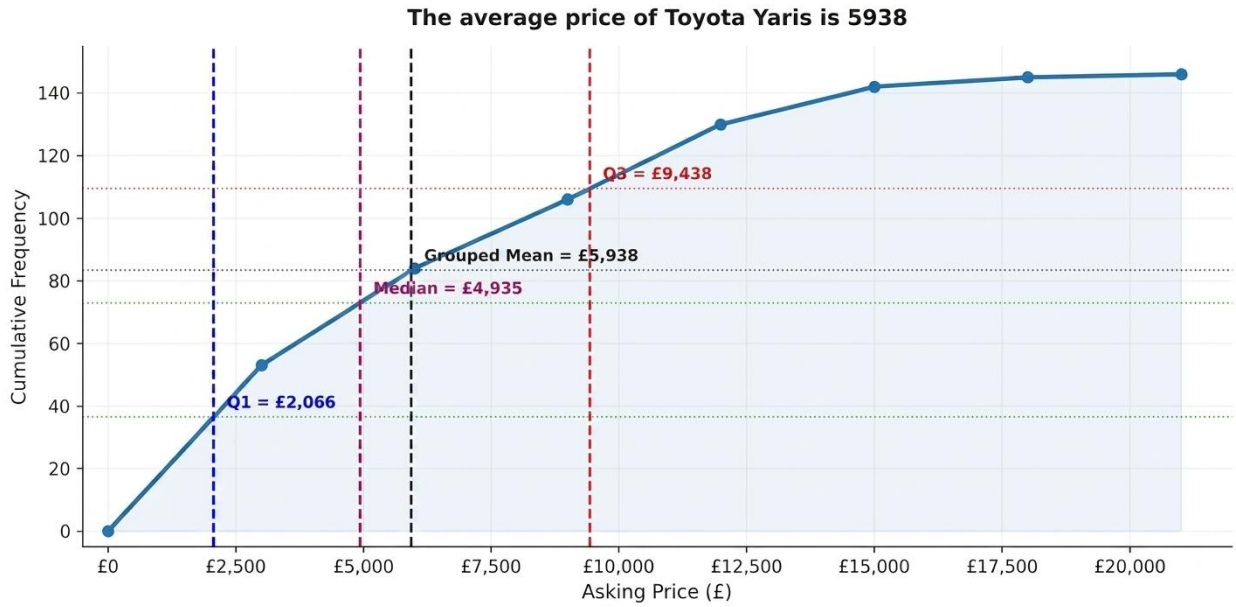

2.1 Most Common Prices

A frequency chart with £3,000 price intervals was created to display how asking prices are distributed across the dataset. Visualizing this data helps highlight key market trends and patterns that might otherwise be missed in a standard table.

The data reveals a right-skewed distribution, featuring a heavy concentration at the budget end and a tapering tail toward higher prices: The £1,500 midpoint has the highest volume, with 53 vehicles (over 36%). Volume drops to 31 vehicles at £4,500 and 22 vehicles at £7,500. There is a minor uptick to 24 vehicles at £10,500. Beyond £10,500, counts decline rapidly: 12 vehicles at £13,500, 3 vehicles at £16,500, and just 1 vehicle at £19,500. Ultimately, this profile demonstrates that while the local Birmingham market is dominated by affordable, older Toyota Yaris models, a small subset of higher-value vehicles stretches the right tail, pulling the overall mean price above the median.

2.2 Quartile Distribution

A cumulative frequency curve was created to show the percentage of vehicles priced below specific thresholds, helping readers easily track how inventory builds up as prices increase (Few, 2012).

For visual clarity, key reference points—Q1, the Median, the Grouped Mean, and Q3—are annotated directly on the chart using vertical dashed lines and color-coded labels, keeping the graphic self-contained (Tufte, 2001). Horizontal gridlines also align with IBCS guidelines (Hichert & Faisst, 2019) for easy value readouts.

The underlying metrics highlight a right-skewed market:

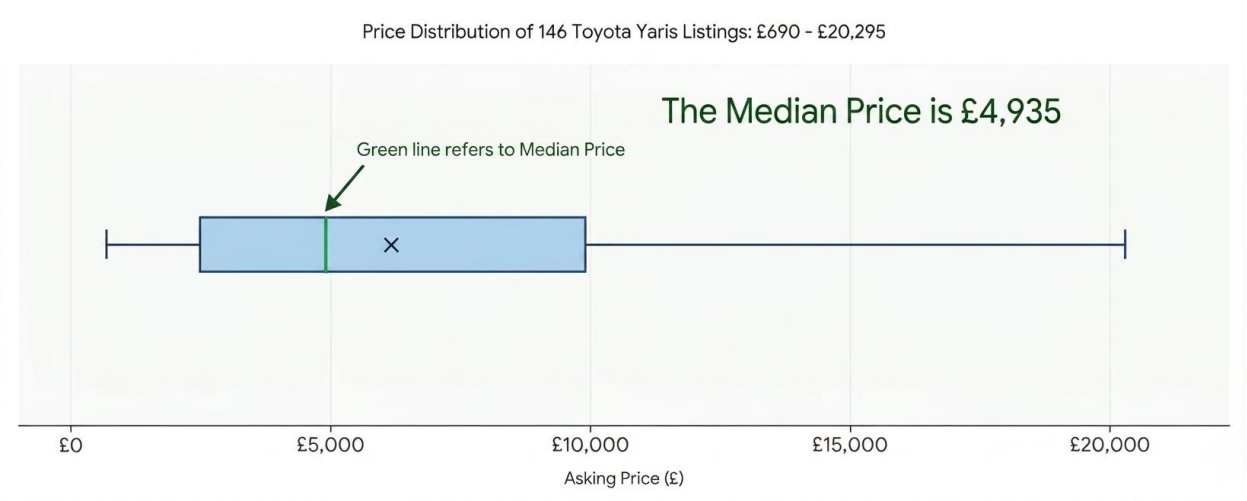

First Quartile (Q1 = £2,066): Represents the bottom 25% of the market, showing that a quarter of all listings are older, budget-friendly models.

Median (Q2 = £4,935): Marks the midpoint, meaning half of the listed Toyota Yaris models are priced under £4,935.

Grouped Mean (£5,938): Exceeds the median by £1,003, confirming the right-skewed trend as high-priced stock pulls the average up.

Third Quartile (Q3 = £9,438): Shows that 75% of vehicles cost less than £9,438, while the top 25% stretch up to £20,000+ for newer hybrid models.

2.3 Price Spread

The box plot shows Yaris prices spanning from **£690 to £20,295** across 146 listings, reflecting a diverse market of older budget models and high-spec hybrids.

Key statistical takeaways:

Right-Skewed Distribution: The median price (**£4,935**) sits well below the mean (**£5,938**), confirming that a small group of high-value, newer models pulls the average upward.

Broad Spread: The middle 50% of listings (IQR) spans **£7,372**—from **£2,066 (Q1)** to **£9,438 (Q3)**.

Because of this wide variation, relying solely on an average price would lead to inaccurate valuations in the local market.

3. SAMPLE ANALYSIS

To make the detailed statistical evaluation manageable while maintaining technical rigor, a probability sample of 121 vehicles was randomly selected from the full baseline population of 146 Toyota Yaris listings. This extraction was conducted using the RANDBETWEEN() function in Microsoft Excel. Adopting a probabilistic sampling design guarantees that every active listing has an equal opportunity of selection, removing researcher bias and yielding a sample that reliably reflects the broader regional market structure (Saunders, Lewis and Thornhill, 2019).

The key descriptive metrics for the sampled dataset are summarized below:

Average Price : **£** 5940

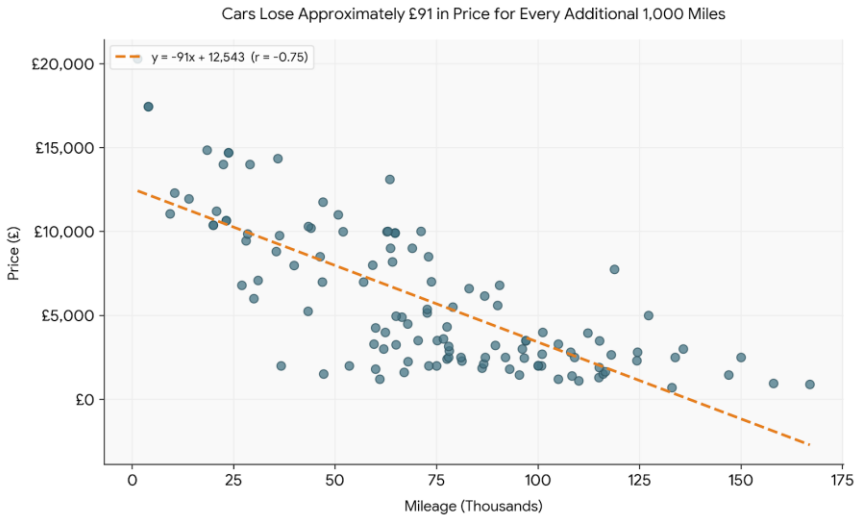

Grouped Mean Price: £5740

Average Mileage: 72218 Miles

Average No of Doors: 4.74 ~ 5 Doors

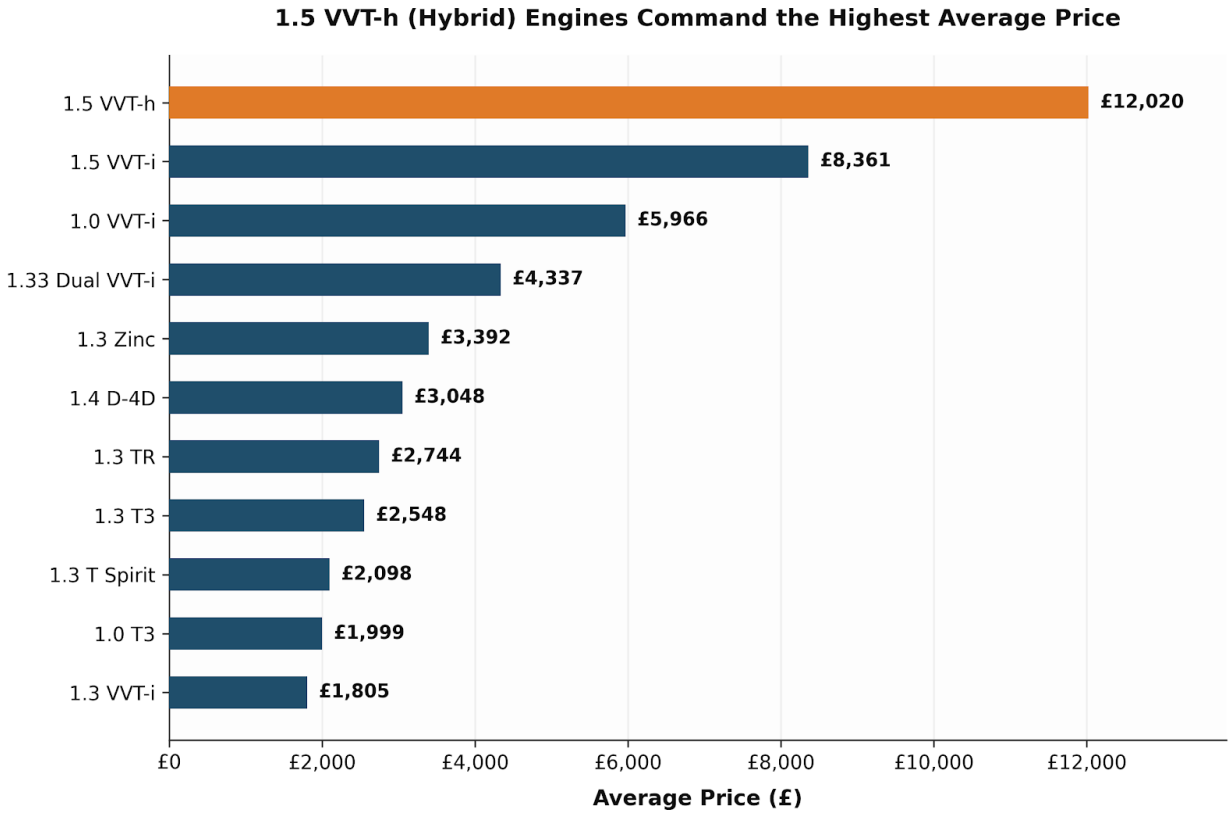

Sample Size: 121

3.1 Mileage and Price

To examine the relationship between vehicle mileage and asking price, a scatter plot was constructed—the standard approach for visualizing the direction, pattern, and overall strength of association between two continuous variables (Field, 2018).The fitted regression line (y = -91x + 12,543) highlights a clear trend: for every additional 1,000 miles recorded on the odometer, the vehicle's asking price drops by approximately £91. This represents a substantial market impact. With a correlation coefficient of r = -0.75, the data demonstrates a strong negative linear relationship, proving that cumulative mileage is one of the single most influential drivers of price depreciation for a used Toyota Yaris. Buyers in the Birmingham market consistently pay a distinct premium for lower-mileage stock, providing crucial guidance for how local dealerships should evaluate, source, and price their inventory.

3.2 Engine Size and Price

In the used Toyota Yaris market, pricing closely follows a combination of engine size, power output, vehicle age, and mileage:

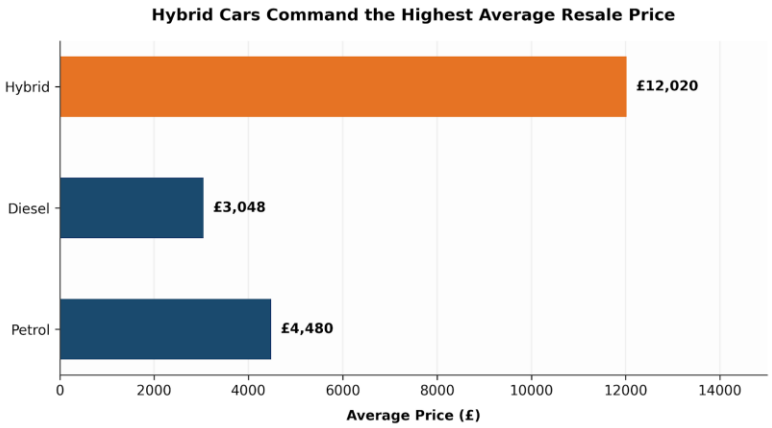

1.5-Litre Engines (Average Price: £8,361 – £12,020): These represent newer, low-mileage vehicles (typically 30,000–50,000 miles). Buyers pay premium prices for their higher power, modern equipment, and strong fuel efficiency.

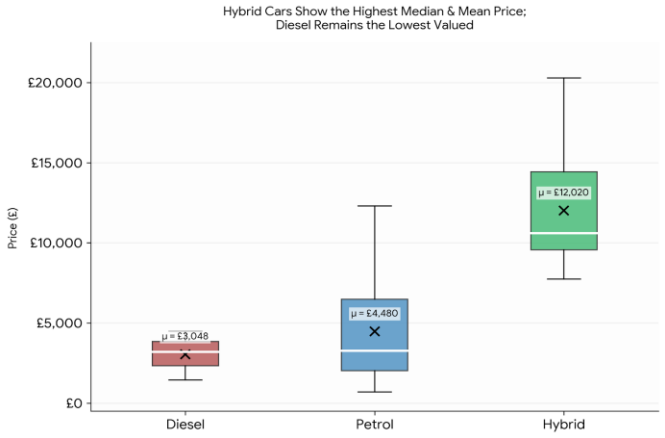

1.0-Litre Engines (Average Price: £5,966): Typically mid-aged cars with moderate mileage (50,000–65,000 miles). Despite lower horsepower, low insurance costs and urban practicality keep their mid-tier resale value stable.

1.3L & 1.4L Engines (Average Price: £1,805 – £4,337): Primarily older models with higher mileage (75,000 to over 110,000 miles). Higher mileage drives down market value, making them the most budget-friendly choices available.

Low-mileage, newer 1.5L variants occupy the premium price tier, whereas older, higher-mileage 1.3L and 1.4L models form the entry-level budget segment.

3.3 Fuel Type and Price

These two charts show how fuel type directly impacts used Toyota Yaris prices in terms of overall averages and price distributions.

Chart 1:
A horizontal bar chart compares average asking prices across fuel types using a clean, easy-to-read layout (Few, 2012; Tufte, 2001):

Hybrids: Lead the market with a highest average price of £12,020, highlighted in orange for immediate emphasis (Hichert & Faisst, 2019).

Petrols: Occupy the middle tier, averaging £4,480.

Diesels: Represent the entry-level segment with the lowest average price at £3,048.

Chart 2:

The box plot provides deeper detail, displaying median prices, mean values ('x'), and full price ranges by fuel type:

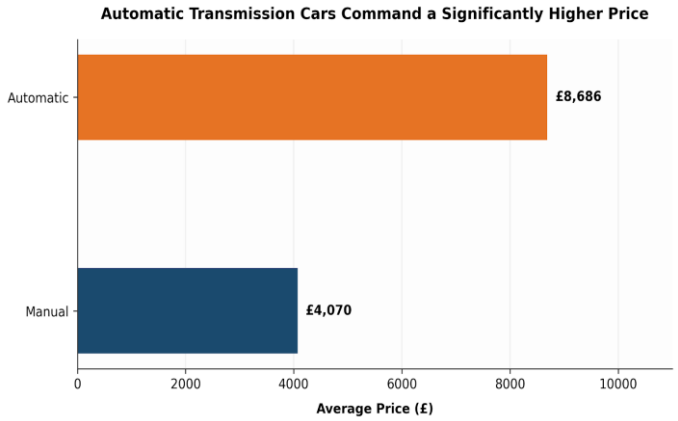

Hybrids: Command top values across the board, featuring a £10,500 median, a £9,500–£14,500 interquartile range (IQR), and peak prices reaching £20,000. High-value newer stock pulls the £12,020 mean above the median.

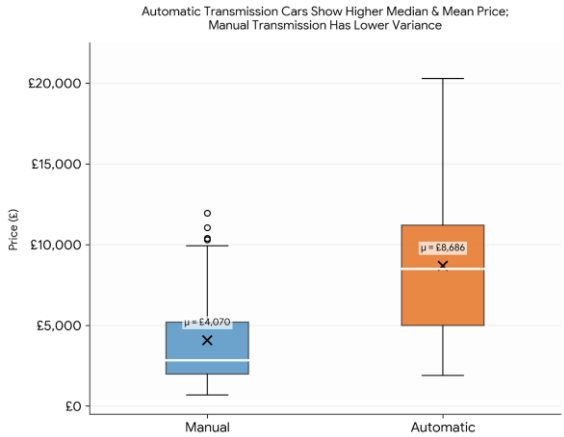

Petrols : Cover a broad £1,000 to £12,000+ range, featuring a £3,500 median and a middle 50% spread of £2,000 to £6,500, reflecting a mix of older budget cars and newer models.

Diesels : Display the narrowest price range and lowest overall values, clustering tightly between £2,300 and £4,000 with a £3,000 median.

Fuel technology creates a distinct market split. Hybrids command a steep premium due to high demand for efficiency, low emissions, and newer model years, while petrol and diesel variants cater to budget-focused buyers at lower price points.

3.4 Gear Type and Price

These two charts illustrate how gearbox choice—automatic versus manual—directly impacts the market value of used Toyota Yaris listings across both average prices and overall price distributions.

Chart 1:

A clean horizontal bar chart compares average asking prices by transmission type (Few, 2012; Tufte, 2001):

Automatic Premium: Automatic listings average £8,686, highlighted in orange to emphasize the higher-value market.

Manual Segment: Manual models average £4,070, selling for less than half the average price of automatics.

Chart 2

The box plot provides additional context by displaying median prices, mean averages ('X'), and price spreads:

Automatic : Features a much higher baseline and broader spread, with an £8,500 median, a £5,000–£11,200 interquartile range (IQR), and a peak of £20,295. The £8,686 mean closely aligns with the median, reflecting market weight toward newer stock.

Manual : Shows a lower, narrower price range with a £3,000 median and most inventory clustered between £2,000 and £5,200. A few outliers up to £12,000 pull the mean (£4,070) slightly above the median.

Automatics cost more than double the price of manuals. This premium is heavily driven by inventory overlap: Toyota's hybrid models are strictly automatic, while older, high-mileage budget cars are primarily manual

4. HYPOTHESIS TESTING

Hypothesis testing provides a rigorous statistical framework to confirm whether the observed sample patterns reflect genuine market dynamics or are merely the result of random sampling variation. All tests are conducted using a standard significance threshold is 0.05

4.1 One Sample T-test

To ensure that the sample of n = 121 vehicles is a statistically reliable representation of the overall Birmingham market population N = 146, One-Sample T-test was conducted comparing the sample mean price to the population grouped mean price.

Null Hypothesis (H_0): Sample average mean price = Population average mean price

Alternative Hypothesis (H_1): Sample mean price ≠ Population mean price

Population Mean	Sample Mean	T-statistic	P-Value (two tail)
£ 5938	£ 5738	-0.4965	0.6205

Result: Fail to Reject H_0. p = 0.6190 > 0.05,

With a p-value of 0.6190, which comfortably exceeds the 0.05 threshold, the difference between the sample mean of £5738 and the population mean of £5938 is not statistically significant. The 95% confidence interval for the sample mean contains the population mean, lending further weight to this conclusion.

Although the sample's average price is marginally lower than the overall market average, this gap is well within the bounds of what could arise through chance in random selection alone. The sample can be treated with confidence as a fair and representative snapshot of the Birmingham Toyota Yaris market, and the analysis that follows is built on solid ground.

4.2 Independent Sample T-Test

Evaluating the grouped price midpoint across transmission / gear types:

Null Hypothesis (H_0): $\mu_{Automatic} = \mu_{Manual}$ (No difference in mean price between transmission types)

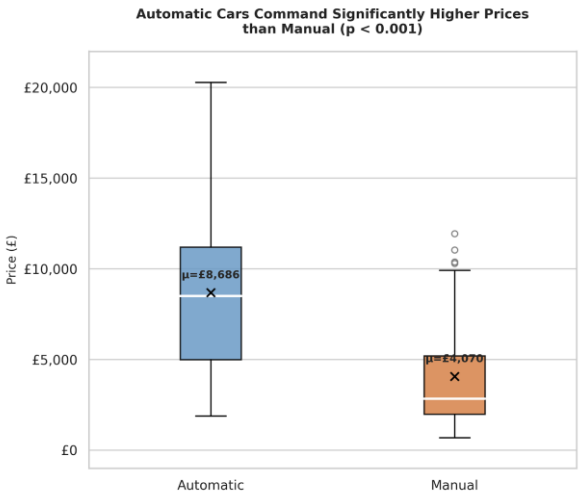

Alternative Hypothesis (H_1): $\mu_{Automatic} \neq \mu_{Manual}$ (Mean price differs significantly by transmission type)

Gear / transmission type	Sample Size	Average price	SD	SE
Automatic	49	£ 8686	£4,619.28	£659.90
Manual	72	£ 4070	£3,040.19	£358.29

Result: Reject the Null Hypothesis (H_0)

An independent Welch t-test confirms that price difference is highly statistically significant $t(76) = 6.15$, $p < 0.001$). Automatics average £8,686 while manuals average £4,070—a clear £4,616 gap that goes far beyond random sampling variation.

Simply, this is one of the clearest and most actionable findings in the dataset, automatic Toyota Yaris listings command significantly higher prices in the used market. This structural price gap is strongly tied to how powertrains are distributed across models.

Because automatic transmissions and modern low-emission powertrains usually come paired in this vehicle segment, isolating their individual impacts on listing prices requires multivariate regression modeling.

4.3 One Way ANOVA

To test whether mean asking price differs significantly across fuel types, a one-way ANOVA was conducted. This test is the appropriate choice when comparing means across three or more categories: Petrol, Hybrid, and Diesel

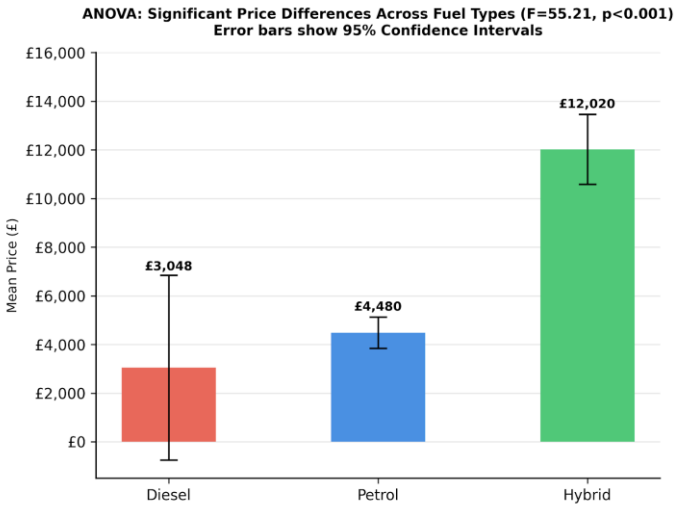

Fuel Type	Sample size	Avearage price	SD
Hybrid	24	£ 12020	£3,400.81
Diesel	3	£ 3048	£3,142.40
Petrol	94	£ 4480	£1,528.16

Null Hypothesis (H_0): Average prices are equal for all fuel types ($\mu_{Hybrid}=\mu_{Petrol}=\mu_{Diesel}$)

Alternative Hypothesis (H_1): At least one fuel type has a significantly different average price.

Result: Reject the Null Hypothesis (H_0)

A One-Way ANOVA test (F = 55.21, p < 0.001) confirms statistically significant price differences across fuel types. Non-overlapping 95% confidence intervals between hybrid and petrol listings further prove that this gap is both statistically solid and practically meaningful.

Put simply, fuel type is a primary price driver rather than a sampling fluke. Hybrids occupy a much higher price tier due to newer model years and hybrid tech premiums, compared to petrol and diesel alternatives. This price split represents a core structural feature of the used Yaris market rather than a minor detail.

4.4 Chi-Square Test

To explore whether fuel type and transmission type are related — or whether they vary independently of one another — a chi-square test of independence was conducted.

Transmission	Diesel	Hybrid	Petrol
Automatic	0	24	25
Manual	3	0	69

Null Hypothesis (H_0): Gear Type and Fuel Type are **independent** (no relationship).

Alternative Hypothesis (H_1): Gear Type and Fuel Type are **dependent** (a strong relationship exists).

Test Metrics

- Chi-Square Statistic $X^2 = 44.84$
- Df : 2
- p-value < 0.001

Result: Reject the Null Hypothese (H_0).

The Chi-Square test produces a statistic of **$x^2(2)=44.84$, $p<0.001$**, showing a strong, highly statistically significant relationship between transmission and fuel type. We almost never find manual hybrids or automatic diesels in this Yaris dataset. This confirms that transmission choice and engine fuel type are structurally linked in the used market.

5. MULTIVARIATE ANALYSIS — REGRESSION MODEL & PRICE CALCULATOR

Multiple Linear Regression analysis was performed on the extracted dataset to model listing prices based on vehicle specifications and key observational metrics.

5.1 Model Summary

The dependent variable is vehicle listing price in British Pounds (£). The regression model incorporates five primary explanatory variables: Mileage (continuous, in miles), Engine Size (litres, continuous), Automatic Transmission (binary dummy variable: 1 = Automatic, 0 = Manual), Hybrid Powertrain (binary dummy variable: 1 = Hybrid, 0 = Petrol/Diesel), and Doors

Model Metric	Sample Value (n = 121)	Population Value (n = 146)	Description
Multiple R	0.8916	0.9024	Strong overall linear correlation
R-Squared (R^2)	0.7949	0.8144	Explains 79.5% (sample) to 81.4% (population) of price variance
Adjusted R-Squared	0.7860	0.8078	Adjusted for the number of predictors in the model
Standard Error	£2,025.86	£1,944.82	Standard deviation of residual estimation errors
F-Statistic	89.16	122.92	Test for overall regression model significance
Prob (F-Statistic)	6.55×10^{-35}	2.08×10^{-49}	Highly statistically significant ($p < 0.001$)

5.2 Regression Coefficients

The table below outlines the estimated regression parameters derived from the sample dataset (n = 121)

Predictor Variable	Coefficient (β)	Standard Error	t-Statistic	p-value	Significance (α = 0.05)
Intercept (β_0)	**+2,528.57**	2,158.10	1.172	0.2438	Not Significant (p > 0.05)
Mileage (X_1)	**-0.0678**	0.0057	-11.923	< 0.0001	Statistically Significant
Engine Size (X_2)	**+1,263.53**	1,399.33	0.903	0.3684	Not Significant (p > 0.05)
Is Automatic (X_3)	**+349.75**	481.74	0.726	0.4693	Not Significant (p > 0.05)
Is Hybrid (X_4)	**+4,509.13**	700.52	6.437	< 0.0001	Statistically Significant
Doors (X_5)	**+1,181.84**	295.75	3.996	0.0001	Statistically Significant

5.3 Interpretation of Results

Overall Explanatory Power: The model achieves an R^2 of 0.7949, explaining about 79.5% of total vehicle price variation using five key factors. An overall F-test ($F = 89.16$, $p < 0.001$) confirms that combining these variables predicts prices significantly better than a basic average model.

Significant Predictors:

Mileage ($\beta 1 = -0.0678$, $p < 0.0001$): Drives a strong negative effect; holding other factors constant, every extra 1,000 miles reduces market value by roughly £67.80.

Hybrid Powertrain ($\beta 4 = +4,509.13$, $p < 0.0001$): Carries a massive positive premium, adding £4,509.13 over comparable non-hybrid models when controlling for mileage, engine size, doors, and transmission.

Doors ($\beta 5 = +1,181.84$, $p = 0.0001$): Increases market value, adding £1,181.84 per additional door (e.g., upgrading from a 3-door to a 5-door model).

Non-Significant Variables: Engine size ($p = 0.3684$) and automatic gearbox ($p = 0.4693$) do not show independent statistical significance after controlling for hybrid status. as modern Toyota hybrids automatically include 1.5L engines and automatic (E-CVT) transmissions as standard features.

5.4 Price Calculator Equation

Using the estimated parameters, the general linear valuation equation is defined as:

Theoretical Model:

$$Predicted\ Price = \beta_0 + \beta_1(Mileage) + \beta_2(Engine\ Size) + \beta_3(Is_Automatic) + \beta_4(Is_Hybrid) + \beta_5(Doors)$$

Calibrated Sample Model Equation (£):

Predicted Price (£) = 2,528.57 - 0.0678(Mileage) + 1,263.53(Engine Size) + 349.75(Is_Automatic) + 4,509.13(Is_Hybrid) + 1,181.84(Doors)

5.5 Model Evalution

Strengths: High predictive accuracy (R^2 approx 0.795) that effectively captures real-world mileage depreciation alongside hybrid and 5-door price premiums.

Multicollinearity: Strong overlap between hybrid engines and automatic transmissions inflates standard errors, rendering secondary variables like engine size statistically non-significant.

Scope: Calibrated specifically for vehicles up to 167,000 miles; extending it to brand-new or extreme high-mileage cars risks non-linear errors.

RECOMMENDATIONS and CONCLUSION

To optimize profitability and valuation accuracy, market participants should adjust their strategies based on the statistical analysis:

Valuation Strategy: Drop standalone automatic transmission markups, as price premiums belong entirely to the hybrid powertrain rather than the gearbox itself.

Inventory Acquisition: Focus dealership stock on low-mileage, 5-door hybrids, which maximize listing value while minimizing mileage-based depreciation.

Arbitrage Opportunities: Encourage budget buyers to target 3-door petrol variants to capitalize on heavy market discounts well below median prices.

Depreciation Management: Set strict holding limits on high-mileage 1.3L and 1.4L stock due to rapid value erosion and narrow profit margins.
